

ABSTRACT

An aerosol device for dispensing texture material for matching existing acoustical ceiling texture. The device comprises a container, a
5 valve assembly, a dispensing nozzle, a hardenable material, and
pressurized inert gas as a propelling mechanism. The hardenable material
and pressurized inert gas are placed into the container. When the valve
assembly is opened, the inert gas forces the hardenable material out of
the container through the dispensing nozzle. The dispensing nozzle
10 diverts at least a portion of the hardenable material exiting the container to
develop a spray suitable for the application of the hardenable material
onto the ceiling surface being textured. The hardenable material
preferably comprises at least water, filler, binder, and polystyrene
particles. The inert gas is preferably nitrogen.
